Notes:  
1) Although this is the main font in the merged OpenType font, other Type 1 fonts were also merged into the OpenType font, which thus has a larger glyph complement.  
2) Although the glyphs of this font are present in the OpenType font it has been merged into, some or all of those glyphs are not the default forms for characters supported by that font. Such glyphs are only easily accessible in applications that support the relevant OpenType layout features, though they may also be accessible if the application only supports Unicode. See the OpenType User Guide for more information.  
3) This font is a "p" or "symbolic" font. Unless it is also a supplemental font (note 2), see the "OpenType P" font README for important usage notes.  
4) This multiple master font has different instances, each of which corresponds to a different final OpenType font.  
5) This font has no exact match. It was a mathematically narrowed or obliqued font, which was replaced by a font that was designed to be condensed and/or italic. Particularly in the case of obliqued to condensed swaps, metrics are likely to be very different.  
6) Although the characters of this font are present in the OpenType font it has been merged into, accessing these characters requires that the application being used support Unicode to access extended language support from a single font. See the OpenType User Guide for more information.

Notes:  
1) Although this is the main font in the merged OpenType font, other Type 1 fonts were also merged into the OpenType font, which thus has a larger glyph complement.  
2) Although the glyphs of this font are present in the OpenType font it has been merged into, some or all of those glyphs are not the default forms for characters supported by that font. Such glyphs are only easily accessible in applications that support the relevant OpenType layout features, though they may also be accessible if the application only supports Unicode. See the OpenType User Guide for more information.  
3) This font is a "P" or symbolic font. Unless it is also a supplemental font (note 2), see the "OpenType P Font Reader" for important usage notes.  
4) This multiple master font has different instances, each of which corresponds to a different final OpenType font.  
5) This font has no exact match. It was a mathematically narrowed or obliqued font, which was replaced by a font that was designed to be condensed and/or italic. Particularly in the case of obliqued to condensed sways, metrics are likely to be very different.  
6) Although the characters of this font are present in the OpenType font it has been merged into, accessing these characters requires that the application being used support Unicode to access extended language support from a single font. See the OpenType User Guide for more information.

**Notes:**  
1) Although this is the main font in the merged OpenType font, other Type 1 fonts were also merged into the OpenType font, which has a larger glyph complement.  
2) Although the glyphs of this font are present in the OpenType font it has been merged into, some or all of those glyphs are not the default forms for characters supported by that font. Such glyphs are only easily accessible in applications that support the relevant OpenType layout features, though they may also be accessible if the application only supports Unicode. See the OpenType User Guide for more information.  
3) This font is a "p" or "symbolic" font. Unless it is also a supplemental font (note 2), see the "OpenType Pf Font Reader" for important usage notes.  
4) This multiple master font has different instances, each of which corresponds to a different final OpenType font.  
5) This font has no exact match. It was a mathematically narrowed or obliqued font, which was replaced by a font that was designed to be condensed and/or italic. Particularly in the case of obliqued to condensed swaps, metrics are likely to be very different.  
6) Although the characters of this font are present in the OpenType font it has been merged into, accessing these characters requires that the application being used support Unicode to access extended language support from a single font. See the OpenType User Guide for more information.

Notes:  
1) Although this is the main font in the merged OpenType font, other Type 1 fonts were also merged into the OpenType font, which thus has a larger glyph complement.  
2) Although the glyphs of this font are present in the OpenType font it has been merged into, some or all of those glyphs are not the default forms for characters supported by that font. Such glyphs are only easily accessible in applications that support the relevant OpenType layout features, though they may also be accessible if the application only supports Unicode. See the OpenType User Guide for more information.  
3) This font is a "p" or "symbolic" font. Unless it is also a supplementary font (note 2), see the "OpenType P" font README for important usage notes.  
4) This multiple master font has different instances, each of which corresponds to a different final OpenType font.  
5) This font has no exact match. It was a mathematically narrowed or obliqued font, which was replaced by a font that was designed to be condensed and/or italic. Particularly in the case of obliqued to condensed swaps, metrics are likely to be very different.  
6) Although the characters of this font are present in the OpenType font it has been merged into, accessing these characters requires that the application being used support Unicode to access extended layout support from a single font. See the OpenType User Guide for more information.

Notes:  
1) Although this is the main font in the merged OpenType font, other Type 1 fonts were also merged into the OpenType font, which thus has a larger glyph complement.  
2) Although the glyphs of this font are present in the OpenType font it has been merged into, some or all of those glyphs are not the default forms for characters supported by that font. Such glyphs are only easily accessible in applications that support the relevant OpenType layout features, though they may also be accessible if the application only supports Unicode. See the OpenType User Guide for more information.  
3) This font is a "p" or "symbolic" font. Unless it is also a supplemental font (note 2), see the "OpenType P" font README for important usage notes.  
4) This multiple master font has different instances, each of which corresponds to a different final OpenType font.  
5) This font has no exact match. It was a mathematically narrowed or obliqued font, which was replaced by a font that was designed to be condensed and/or italic. Particularly in the case of obliqued to condensed swaps, metrics are likely to be very different.  
6) Although the characters of this font are present in the OpenType font it has been merged into, accessing these characters requires that the application being used support Unicode to access extended layout support from a single font. See the OpenType User Guide for more information.

Notes:  
1) Although this is the main font in the merged OpenType font, other Type 1 fonts were also merged into the OpenType font, which thus has a larger glyph complement.  
2) Although the glyphs of this font are present in the OpenType font it has been merged into, some or all of those glyphs are not the default forms for characters supported by that font. Such glyphs are only easily accessible in applications that support the relevant OpenType layout features, though they may also be accessible if the application only supports Unicode. See the OpenType User Guide for more information.  
3) This font is a "p" or "symbolic" font. Unless it is also a supplemental font (note 2), see the "OpenType P" font README for important usage notes.  
4) This multiple master font has different instances, each of which corresponds to a different final OpenType font.  
5) This font has no exact match. It was a mathematically narrowed or obliqued font, which was replaced by a font that was designed to be condensed and/or italic. Particularly in the case of obliqued to condensed swaps, metrics are likely to be very different.  
6) Although the characters of this font are present in the OpenType font it has been merged into, accessing these characters requires that the application being used support Unicode to access extended language support from a single font. See the OpenType User Guide for more information.

**Notes:**

- 1) Although this is the main font in the merged OpenType font, other Type 1 fonts were also merged into the OpenType font, which thus has a larger glyph complement.
- 2) Although the glyphs of this font are present in the OpenType font it has been merged into, some or all of those glyphs are not the default forms for characters supported by that font. Such glyphs are only easily accessible in applications that support the relevant OpenType layout features, though they may also be accessible if the application only supports Unicode. See the OpenType User Guide for more information.
- 3) This font is a "p" or "symbolic" font. Unless it is also a supplemental font (note 2), see the "OpenType Pi Font Reader" for important usage notes.
- 4) This multiple master font has different instances, each of which corresponds to a different final OpenType font.
- 5) This font has no exact match. It was a mathematically narrowed or obliqued font, which was replaced by a font that was designed to be condensed and/or italic. Particularly in the case of obliqued to condensed swaps, metrics are likely to be very different.
- 6) Although the characters of this font are present in the OpenType font it has been merged into, accessing these characters requires that the application being used support Unicode to access extended layout support from a single font. See the OpenType User Guide for more information.

Notes:  
1) Although this is the main font in the merged OpenType font, other Type 1 fonts were also merged into the OpenType font, which thus has a larger glyph complement.  
2) Although the glyphs of this font are present in the OpenType font it has been merged into, some or all of those glyphs are not the default forms for characters supported by that font. Such glyphs are only easily accessible in applications that support the relevant OpenType layout features, though they may also be accessible if the application only supports Unicode. See the OpenType User Guide for more information.  
3) This font is a "p" or symbolic font. Unless it is also a supplementary font (note 2), see the "OpenType P" font README for important usage notes.  
4) This multiple master font has different instances, each of which corresponds to a different final OpenType font.  
5) This font has no exact match. It was a mathematically narrowed or obliqued font, which was replaced by a font that was designed to be condensed and/or italic. Particularly in the case of obliqued to condensed swaps, metrics are likely to be very different.  
6) Although the characters of this font are present in the OpenType font it has been merged into, accessing these characters requires that the application being used support Unicode to access extended language support from a single font. See the OpenType User Guide for more information.

Notes:  
1) Although this is the main font in the merged OpenType font, other Type 1 fonts were also merged into the OpenType font, which thus has a larger glyph complement.  
2) Although the glyphs of this font are present in the OpenType font it has been merged into, some or all of those glyphs are not the default forms for characters supported by that font. Such glyphs are only easily accessible in applications that support the relevant OpenType layout features, though they may also be accessible if the application only supports Unicode. See the OpenType User Guide for more information.  
3) This font is a "P" or symbolic font. Unless it is also a supplemental font (note 2), see the "OpenType P" font README for important usage notes.  
4) This multiple master font has different instances, each of which corresponds to a different final OpenType font.  
5) This font has no exact match. It was a mathematically narrowed or obliqued font, which was replaced by a font that was designed to be condensed and/or italic. Particularly in the case of obliqued to condensed swaps, metrics are likely to be very different.  
6) Although the characters of this font are present in the OpenType font it has been merged into, accessing these characters requires that the application being used support Unicode to access extended language support from a single font. See the OpenType User Guide for more information.

Notes:  
1) Although this is the main font in the merged OpenType font, other Type 1 fonts were also merged into the OpenType font, which thus has a larger glyph complement.  
2) Although the glyphs of this font are present in the OpenType font it has been merged into, some or all of those glyphs are not the default forms for characters supported by that font. Such glyphs are only easily accessible in applications that support the relevant OpenType layout features, though they may also be accessible if the application only supports Unicode. See the OpenType User Guide for more information.  
3) This font is a "tr" or symbolic font. Unless it is also a supplemental font (note 2), see the "OpenType Ph Font Reader" for important usage notes.  
4) This multiple master font has different instances, each of which corresponds to a different font OpenType feature.  
5) This font has no exact match. It was a mathematically narrowed or oblique font, which was replaced by a font that was designed to be condensed and/or italic. Particularly in the case of oblique to condensed swags, metrics are likely to be very different.  
6) Although the characters of this font are present in the OpenType font it has been merged into, accessing those characters requires that the application being used support Unicode to access extended language support from a single font. See the OpenType User Guide for more information.
